Today, the market for AutoCAD is led by major manufacturers of industrial equipment, such as General Electric, Hitachi, and Honeywell. AutoCAD is also popular among architects, engineers, and drafters in the construction industry.

---

Since its first release, AutoCAD has enjoyed a large and loyal following of users worldwide. Its primary user base is, however, based in North America and Western Europe, although there are AutoCAD users in the rest of the world. AutoCAD is one of the most popular desktop apps in the world. For more information : See more at - [url removed, login to view] Q: Binding using the datacontext to the datatemplate on the viewmodel and dont have the viewmodel as the

---

datacontext Im trying to setup a viewmodel where the user could enter a datatemplate and a viewmodel. What im trying to do is to use the viewmodel to bind the datatemplate to the view using the datacontext as the viewmodel, so the viewmodel is used to setup the binding between the

---

viewmodel and the datatemplate, I want to avoid having to create the viewmodel in the view in this case, but this of course doesn't work if I want to bind to the viewmodel. I don't want to create the viewmodel as the DataContext because then I would have to create a concrete class that

---

implements datacontext in the view that isnt required, but that wont work for other reasons. A: The DataTemplate is bound to a specific type (either a control or a value type) so you don't have to worry about creating an instance of the ViewModel. However, the DataTemplate needs to know what type it is

---

supposed to be binding to. The DataTemplate will not know if the ViewModel is that type or a different type. In order to accomplish this you would need to convert the ViewModel to the type the DataTemplate expects. That would allow you to bind to it. For example, if you have a ListView with a ListViewItemDataTemplate

---

for each item in the list. It would convert the items in the list to the item type expected by the DataTemplate. There are two problems with this though: The first is that you'll have to do a lot of work converting items in the list. The second is that you'll be creating a new list every time the item type changes.
